

3 difference(s) between the rendered conversion and the rendered original, listed with their evidence below. There are 5 actions below, 1.11h (\$167) in total, of which 1 item(s) block release.

1.11h

to finish this report (\$167)

4.5h

to rebuild it by hand instead (\$675)

\$525

avoided - 78% of a from-scratch rebuild

Action plan

highest priority first; within a priority, the heaviest first

0.50h

P1 | blocks release | 1 item(s) | \$75

0.51h

P2 | correctness | 4 item(s) | \$76

0.10h

P3 | cosmetic | 1 item(s) | \$15

1.Reconcile the rendered output against the originalP1 | blocks release0.50h \$75

**Why it matters.** The release gate rendered both reports and found differences the customer would see on the page - missing values, dropped lines or content that moved. Until these are closed the conversion is not equivalent to the Crystal original.

**How.** Open the .rpt in Report Designer and preview it beside the original in the Crystal viewer (the app's View original button opens both). Work the evidence lines below one at a time; each names the exact value or line that differs.

*Where: orphaned-total*

- 21 statement(s) print their total on a page of its own, away from the statement it belongs to - the original keeps them together

2.Review the flagged layout differencesP2 | correctness0.25h \$38

**Why it matters.** Content that reflowed or pages that filled differently. Not wrong data, but the customer notices a total that slipped onto its own page.

**How.** In Report Designer, check band heights and the Keep Together flag on the groups named below (right-click the group band > Attributes).

*Where: appearance*

- REPORT-WIDE: the middle of the page differs on 58 of the 58 page(s) compared. It is one difference in a band that repeats, not one per page - a single fix covers every statement

3.Wire up the data sourceP2 | correctness0.20h \$30

**Why it matters.** The bundle carries 53 rows recovered from the .rpt so it opens and renders with no database. That is a preview dataset, not a live feed.

**How.** When the customer is ready for live data, Data tab > swap the inline table for the JNDI datasource already defined in the bundle (SampleData), then verify the generated SELECT - joins and aliases especially.

*Where: SampleData*

4.Glance over the formulas that translated with a caveatP2 | correctness0.06h \$9

**Why it matters.** These produce a value; the question is whether it is the value Crystal produced. Scope and rounding are the usual differences.

**How.** Compare each against the Crystal original - the conversion report prints them side by side.

*Where: Late Invoices, statement amount*

- Late Invoices: Crystal If without Else: default branch emitted (0) to match Crystal's implicit default

- statement amount: Sum aggregate rewritten as a PRD TotalGroupSumFunction over [ORDER\_AMOUNT] grouped by [CUSTOMER\_NAME] - verify scope matches the Crystal placement

**Why it matters.** Items that need a judgement call but do not fall into a group.

**How.** Each note names what the pipeline found and why it stopped.

- special field in text rendered as "page n / m" ( $\$(\text{PageofPages})$ ) - adjust the format in PRD if the report showed only the bare number

How the two renders compare

the original through the SAP viewer, the conversion through the Pentaho engine

|                       |                        |                                                          |
|-----------------------|------------------------|----------------------------------------------------------|
| 74<br>pages, original | 58<br>pages, converted | 36 of 36<br>group(s) span the same pages as the original |
|-----------------------|------------------------|----------------------------------------------------------|

Evidence - where the renders differ

1. [orphaned-total] 21 statement(s) print their total on a page of its own, away from the statement it belongs to - the original keeps them together
- Cycles and Sports: total alone on converted p3
  - Magazzini: total alone on converted p7
  - Canal City Cycle: total alone on converted p9
  - Alley Cat Cycles: total alone on converted p14
  - Benny - The Spokes Person: total alone on converted p16
  - Blazing Saddles: total alone on converted p19
2. [pages] the conversion is more compact: 58 pages vs 74 - the original leaves near-empty spill pages (43 of them) that the conversion consolidates; every statement still spans the same pages as the original
3. [appearance] REPORT-WIDE: the middle of the page differs on 58 of the 58 page(s) compared. It is one difference in a band that repeats, not one per page - a single fix covers every statement
- 15%-29% of each page affected
  - e.g. original p47 vs converted p39 (29% of the page)

What converted

|               |                                          |
|---------------|------------------------------------------|
| Bands         | 21                                       |
| Elements      | 41                                       |
| Groups        | 2                                        |
| Parameters    | 0                                        |
| Summaries     | 3                                        |
| Sub-reports   | 0                                        |
| Formulas      | 3 translated   2 to check   0 to rebuild |
| Data source   | SampleData                               |
| Embedded rows | 53                                       |

Conversion and the render comparison are deterministic; any LLM resolution note is advisory and marked as such. Effort is costed at \$150/h. Nothing in this report is a guess: where the pipeline could not prove a conversion it says so rather than emitting something that looks right.
